

Transition and Lifelong Care in Congenital Urology (Current Clinical Urology)

Transitional Urology is designed to fill a critical gap that exists in the published literature by comprehensively addressing the urological challenges facing adolescents and adults with complex congenital anomalies of the genitourinary system. It provides a valuable resource to pediatricians and pediatric urologists facing urological management issues beyond their expertise in their aging patients as well as technical guidance to adult urologists who may have had little or no experience caring for patients with a congenital condition. This work will serve as a field guide to congenitalism, providing a how-to approach to guide the urologist using real clinical examples for the most common and challenging urological problems encountered. It also provides a framework for the transition process from pediatric to adult-centered care, with a special emphasis on the multidisciplinary nature needed to provide patient-centered care. Specific conditions that require special consideration, including myelomeningocele, exstrophy, posterior urethral valves, and hypospadias are highlighted. Topics considered common in the general urology practice—like infertility and sexual dysfunction—are addressed within the context of patients with neurological or anatomical complexity. In addition, this text reviews urological complaints for which basic clinical algorithms are well-established within the context of a congenitally-abnormal bladder. Chapters discuss how and when special testing like video urodynamics and positional fluoroscopy may be warranted to provide critical diagnostic guidance. The text also reviews how typical age-related urological phenomena, like elevated PSA, hypogonadism, and BPH, may present in this subset of patients and how treatment of these conditions may be different than the general population.?
